CLASS HOSTING PLATFORM

Every student publishes their own website. In one command.

A free, open-source platform for teachers. It runs in **your own AWS account**.

Public beta · MIT licence

THE PROBLEM

Getting student sites online is a mess.

Accounts and servers to set up

before anyone writes a line of code

Keys to hand out and keep safe

for every single student

A teacher left babysitting all of it

instead of teaching

HOW IT WORKS

Install once. Students get a token, not AWS access.

You, the teacher

One command installs everything in your own AWS account.

↓

Your AWS account

Teacher page, student sites, and the features you choose to switch on.

Sites · Backend · Class AI · Storage · Custom domain

↓

Your students

Each gets a personal address and a token. That is all they need.

FOR THE TEACHER

Create a token. Share it.

One token per student

shown once, with a ready-made message to send them

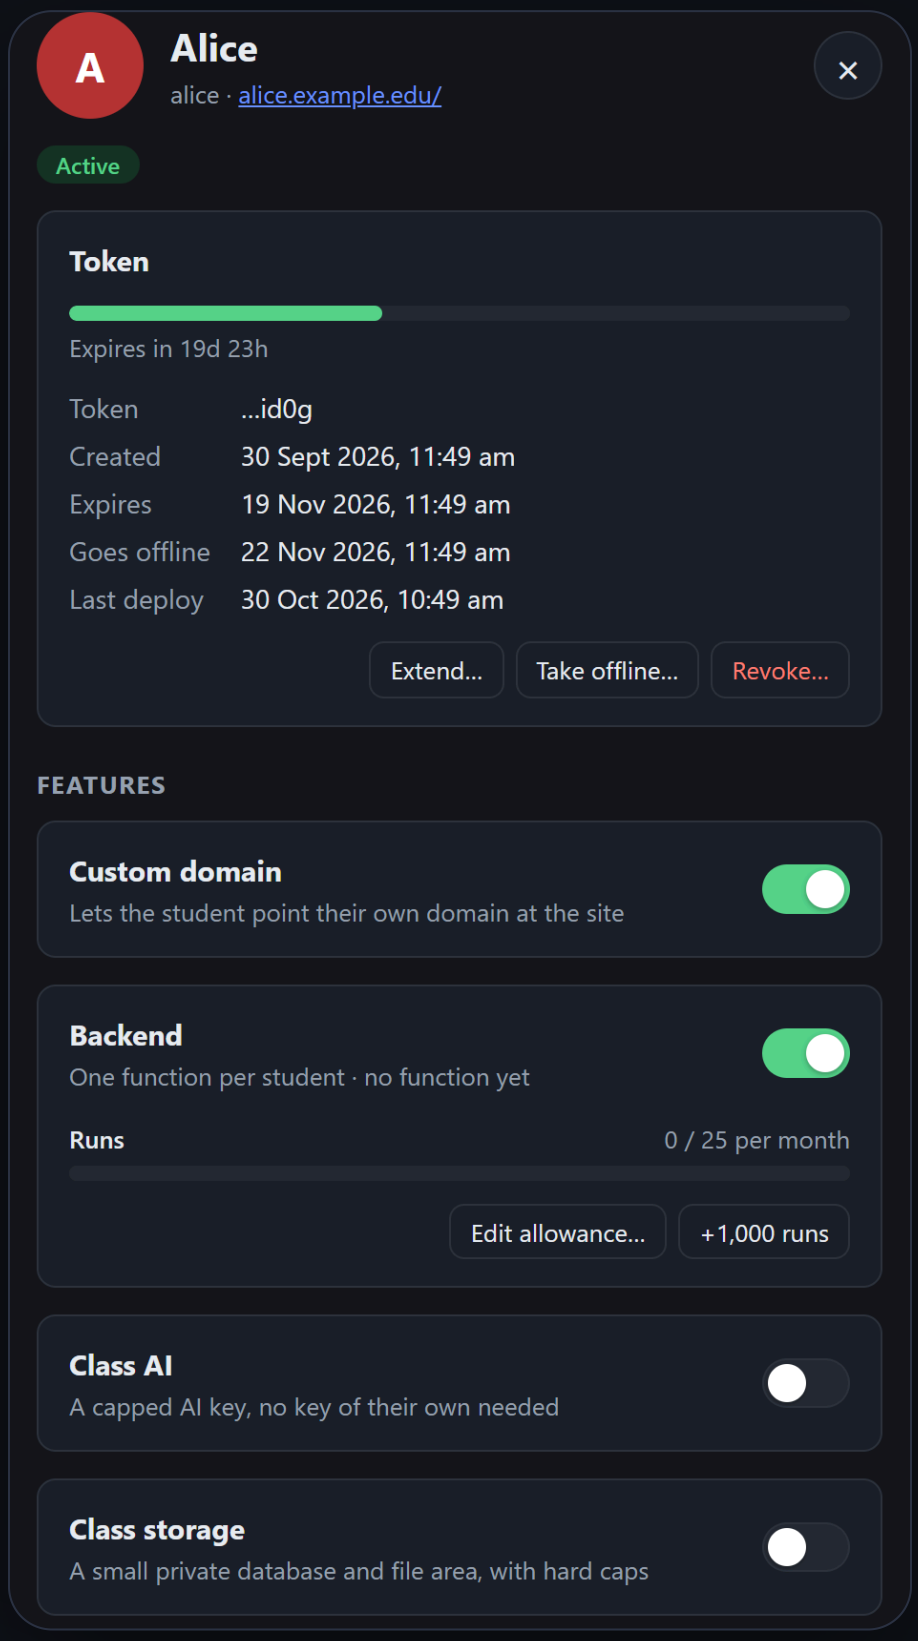

You choose how long it lasts

then extend it, take the site offline, or revoke it

Tokens are stored only as hashes. A lost one is replaced, never recovered.

YOUR CONTROL

You decide what each student can use.

Backend, class AI, storage, custom domain

each switched on per student

Everything starts off

with allowances and AI spending caps you set

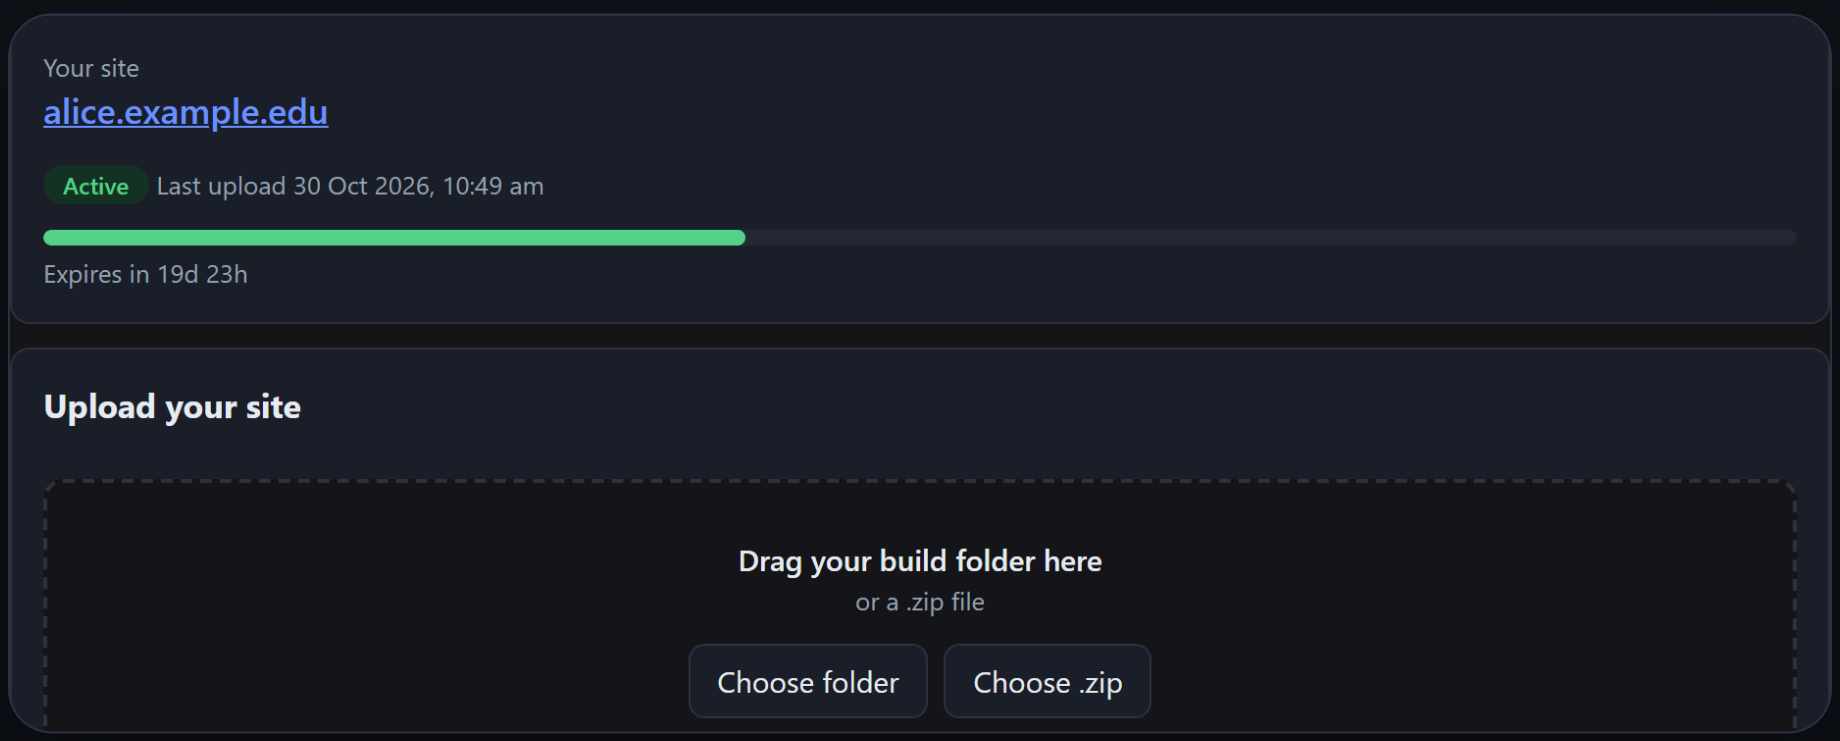

Change your mind any time

a switch works straight away

FOR THE STUDENT

Publish from their AI editor.

1. Sign in with the token
2. Tell the editor: `"set up my class project"`
3. Then: `"publish my site"`

SAFE, AND HONEST

Built to be safe to run.

- ✓ Updates are a plan you review first
- ✓ Backup, and a clean "destroy"
- ✓ Open source, with signed releases

Honest status: public beta

Tested end to end on real AWS accounts, mostly by the author. No third-party security review yet.

TESTERS WANTED

Teach, and have an AWS account? Give it 30 minutes.

Run the install. Tell us exactly where you got stuck.
